<sup>2</sup>Harvard University

October 18, 2021

#### Structured Models

- Explicitly model output associations
  - Directly or through latent variables
- ► Focus on combinatorially large latent discrete structures
  - Complementary to continuous, distributed representations

## Scaling Structured Models

- ▶ Prior work demonstrated: Size Performance
  - ► Hidden Markov Models (HMM)¹
  - ► Probabilistic Context-Free Grammars (PCFG)<sup>2</sup>
- ► This work: low-rank matrix factorizations
  - Generalize to hypergraph models

<sup>&</sup>lt;sup>1</sup>Dedieu et al., Learning higher-order sequential structure with cloned HMMs; Chiu and Rush, Scaling Hidden Markov Language Models.

<sup>&</sup>lt;sup>2</sup>Yang, Zhao, and Tu, 'PCFGs Can Do Better: Inducing Probabilistic Context-Free Grammars with Many Symbols'.

#### Inference as Matrix-Vector Products

- ► Inference: sequence of matrix-vector products
- ► Speed up via fast matvec methods
- Applies to a large family of structured models

#### Fast Matrix-Vector Products

- ▶ Matvecs take  $O(L^2)$  computation
- Various fast methods
  - Sparsity (nnz entries)
  - ► Fast Fourier Transform (*L* log *L*)
  - ► <u>Low-Rank factorization</u> (*LR*)
- ► Connected to efficient attention and kernel approximations<sup>3</sup>

<sup>&</sup>lt;sup>3</sup>Choromanski et al., *Rethinking Attention with Performers*; Peng et al., *Random Feature Attention*; Blanc and Rendle, *Adaptive Sampled Softmax with Kernel Based Sampling*.

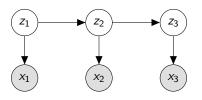

## Roadmap

- ▶ Inference in HMMs and PCFGs as matvecs
- Low-rank matvec inference
- ► Generalization to hypergraph inference
- Experiments

## Inference as Matvecs

## Hidden Markov Models (HMMs)

For times t, model states  $z_t \in [L] = \mathcal{L}$ , and tokens  $x_t \in [X] = \mathcal{X}$ ,

with joint distribution

$$p(x,z) = \prod_{t} p(x_t \mid z_t) p(z_t \mid z_{t-1})$$

#### Inference in HMMs

Given observed  $x = (x_1, \dots, x_T)$ , we wish to maximize

$$p(x) = \sum_{z_1} \cdots \sum_{z_T} p(x, z) = \mathbf{1}^\top \Psi_1 \Psi_2 \cdots \Psi_T \mathbf{1},$$

where

$$\begin{aligned} [\Psi_t]_{z_t, z_{t+1}} &= p(z_{t+1}, x_t \mid z_t) \\ [\Psi_1]_{z_1, z_2} &= p(z_2, x_1 \mid z_1) p(z_1) \end{aligned}$$

### Matvec Inference in HMMs

#### Algorithm 1 HMM Inference

$$\begin{array}{c} \textbf{for} \ t \leftarrow (t+1) \ \text{in right-to-left order do} \\ \beta_t \stackrel{+}{\leftarrow} \Psi_t \beta_{t+1} \\ \textbf{return} \ \beta_0^{-1} \mathbf{1} \end{array}$$

## Probabilistic Context-Free Grammars (PCFG)

A context-free grammar  $\mathcal{G} = (\mathcal{L}, \mathcal{R})$  where

 $\mathcal{L}$ : Node labels;  $\mathcal{X}$ : Tokens;  $\mathcal{R}$ : Rules,

where rules take the form

$$A \rightarrow B C$$
,  $A, B, C \in \mathcal{L}$   
 $P \rightarrow x$ ,  $P \in \mathcal{L}, x \in \mathcal{X}$ 

In a PCFG, each rule has probability mass

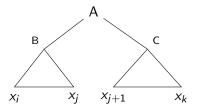

$$p(r) = p(B, C \mid A)$$

The joint distribution over rules in a tree t

$$p(t) = \prod_{r \in t} p(r)$$

#### Inference in PCFGs

- For a given observation x, compute  $p(x) = \sum_{t: y \in Id(t) = x} p(t)$  via dynamic programming
- ▶ For each span (i, k), sum over split point  $j \in (i, k)$ :

Similar to HMMs, define

$$[\Psi]_{z_u,(z_1,z_2)} = p(B=z_1, C=z_2 \mid A=z_u),$$

for each rule

#### Matvec Inference in PCFGs

#### Algorithm 2 PCFG Inference

for 
$$(i,k) \leftarrow (i,j), (j,k)$$
 in span-size order do for  $z_1, z_2 \in \mathcal{L}_{i,j} \times \mathcal{L}_{j,k}$  do 
$$[\beta_{i,j,k}]_{(z_1,z_2)} = [\alpha_{i,j}]_{z_1} [\alpha_{j,k}]_{z_2}$$
  $\alpha_{i,k} \stackrel{+}{\leftarrow} \Psi_{i,j,k} \beta_{i,j,k}$  return  $\alpha_{1}^{\top} {}_{\tau} \mathbf{1}$ 

# Speeding Up Inference

#### Low-Rank Factorization

► Factor matrices  $\Psi = UV^{\top}$ ,  $U \in \mathbb{R}^{L \times R}$ ,  $V \in \mathbb{R}^{L' \times R}$ 

$$\boxed{ \qquad \qquad } \times \boxed{\beta} = \boxed{U} \times \left( \boxed{V^{\top}} \times \boxed{\beta} \right)$$

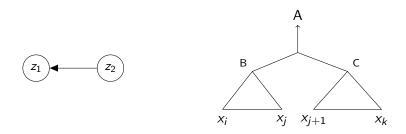

▶ Two matrix-vector products of cost O(LR) and O(L'R)

## Expressiveness and Generality

- Rank constraints limit expressivity
- Only apply to a subset of parameters
  - ► Transition matrix for HMMs
  - Subset of the transition matrix for PCFGs
- Is it more expressive than a smaller model?
  - An L-state HMM with rank R (< L) is more expressive than an R-state HMM
- What other models does this work for?
  - Hypergraph models!

## Hypergraph Marginalization

- Models where exact inference is a directed acyclic hypergraph
- Hypergraph contains a node set and hyperedge set
  - ► Nodes have label set £
  - ightharpoonup Hyperedges join a single head node u and a list of tail nodes v

Hyperedge representations for HMMs and PCFGs

# Hypergraph Marginalization Algorithms

Algorithm 3 Hypergraph marginalization	
<b>for</b> $u \leftarrow v$ hyperedge $e$ topologically <b>do</b>	
$\beta_{\mathbf{v}} \leftarrow \alpha_{\mathbf{v}_1} \alpha_{\mathbf{v}_2}^{\top}$	$\triangleright O(L^{ e })$
$\alpha_{\it u} \stackrel{+}{\leftarrow} \Psi_{\it e} \beta_{\it v}$	$\triangleright O(L^{ e +1})$
return $lpha_{\mathcal{S}}^{ op}1$	

Algorithm 4 Low-rank marginalization	
<b>for</b> $u \leftarrow v_1, v_2$ hyperedge $e$ topologically <b>do</b>	
$\beta_{\mathbf{v}} \leftarrow \alpha_{\mathbf{v}_1} \alpha_{\mathbf{v}_2}^{\top}$	$\triangleright O(L^{ e })$
$\gamma \leftarrow V_e^ op eta_v^ op$	$\triangleright O(L^{ e }R)$
$\alpha_{\it u} \stackrel{+}{\leftarrow} U_{\it e} \gamma$	$\triangleright O(LR)$
return $lpha_{\mathcal{S}}^{ op} 1$	

# Experiments

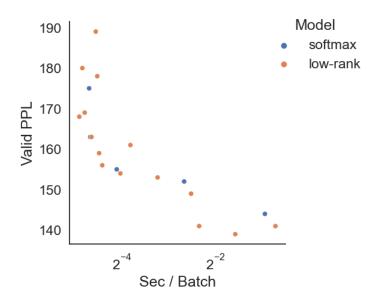

## **Experiments**

- Compare speed vs accuracy frontier
- ► Language modeling on PENN TREEBANK<sup>4</sup>
  - Softmax HMM and PCFG vs low-rank versions (LHMM, LPCFG)
  - Evaluate accuracy with perplexity, a function of likelihood
- ▶ Video modeling on CrossTask<sup>5</sup>
  - Softmax HSMM vs low-rank HSMM
  - Evaluate accuracy with negative log-likelihood

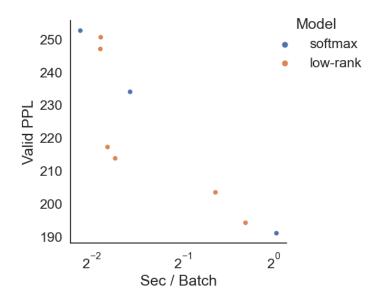

<sup>&</sup>lt;sup>4</sup>Marcus, Santorini, and Marcinkiewicz, 'Building a Large Annotated Corpus of English: The Penn Treebank'.

<sup>&</sup>lt;sup>5</sup>Zhukov et al., 'Cross-task weakly supervised learning from instructional videos'.

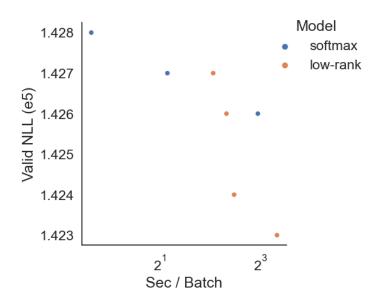

## HMM Speed vs Accuracy

## PCFG Speed vs Accuracy

# **HSMM Speed vs Accuracy**

#### Conclusion

- ▶ Introduce a low-rank factorization to speed up inference
- ► Applies to models with hypergraph inference
- Most effective with large models
