Structured Models

- ► Explicitly model output associations
 - Directly or through latent variables
- ► Focus on combinatorially large latent discrete structures
 - Complementary to distributed representations

Scaling Structured Models

- ► Prior work demonstrated: Size ↑ Performance ↑
 - ► Hidden Markov Models (HMM)
 - Probabilistic Context-Free Grammars (PCFG)
- Prior work scaled via
 - Sparsity for HMMs¹
 - Low-rank tensor decompositions for PCFGs²
- ► This work: low-rank matrix constraints
 - More general
 - Less speedup

¹Chiu and Rush, Scaling Hidden Markov Language Models.

Inference as Matrix-Vector Products

- ► Inference: sequence of matrix-vector products
- Speed up via fast matvec methods
- Applies to a large family of structured models

Fast Matrix-Vector Products

- ▶ Matvecs take $O(L^2)$ computation
- Various fast methods
 - Sparsity (nnz entries)
 - ► Fast Fourier Transform (L log L)
 - ightharpoonup Low-Rank factorization (LR)
- ► Connected to efficient attention and kernel approximations³

Roadmap

- ► Inference in HMMs
- Inference in PCFGs
- Low-rank matvec inference
- Generalization to hypergraph inference
- Experiments

Hidden Markov Models (HMMs)

For times t, model states $z_t \in [L] = \mathcal{L}$, and tokens $x_t \in [X] = \mathcal{X}$,

with joint distribution

$$p(x,z) = \prod_{t} p(x_t \mid z_t) p(z_t \mid z_{t-1})$$

Inference in HMMs

Given observed $x = (x_1, \dots, x_T)$, we wish to maximize

$$p(x) = \sum_{z_1} \cdots \sum_{z_T} p(x, z) = \mathbf{1}^\top \Psi_1 \Psi_2 \cdots \Psi_T \mathbf{1},$$

where

$$\begin{aligned} [\Psi_t]_{z_t, z_{t+1}} &= p(z_{t+1}, x_t \mid z_t) \\ [\Psi_1]_{z_1, z_2} &= p(z_2, x_1 \mid z_1) p(z_1) \end{aligned}$$

Matvec Inference in HMMs

Algorithm HMM Inference

```
\begin{array}{l} \textbf{for} \ t \leftarrow (t+1) \ \text{in right-to-left order do} \\ \textbf{for} \ z_{t+1} \in \mathcal{L} \ \textbf{do} \\ [\beta_{t+1}]_{z_{t+1}} = [\alpha_{t+1}]_{z_{t+1}} \\ \alpha_t \stackrel{+}{\leftarrow} \Psi_t \beta_{t+1} \\ \textbf{return} \ \alpha_0^\top \mathbf{1} \end{array}
```

Probabilistic Context-Free Grammars (PCFG)

A context-free grammar $\mathcal{G} = (\mathcal{L}, \mathcal{R})$ where

 \mathcal{L} : Label symbols; \mathcal{X} : Tokens; \mathcal{R} : Rules,

where rules take the form

$$A \rightarrow B C$$
, $A, B, C \in \mathcal{L}$
 $P \rightarrow x$, $P \in \mathcal{L}, x \in \mathcal{X}$

In a PCFG, each rule has probability mass

$$p(r) = p(B, C \mid A)$$

The joint distribution over rules in a tree t

$$p(t) = \prod_{r \in t} p(r)$$

Matvec Inference in PCFGs

Similar to HMMs, define

$$[\Psi]_{z_u,(z_1,z_2)} = p(B=z_1,C=z_2 \mid A=z_u),$$

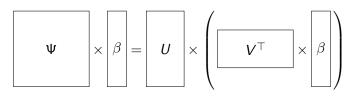

for each rule in R, yielding

Algorithm PCFG Inference

$$\begin{aligned} & \textbf{for } (i,k) \leftarrow (i,j), (j,k) \text{ in span-size order } \textbf{do} \\ & \textbf{for } z_1, z_2 \in \mathcal{L}_{i,j} \times \mathcal{L}_{j,k} \textbf{ do} \\ & [\beta_{i,j,k}]_{(z_1,z_2)} = [\alpha_{i,j}]_{z_1} [\alpha_{j,k}]_{z_2} \\ & \alpha_{i,k} \overset{+}{\leftarrow} \Psi_{i,j,k} \beta_{i,j,k} \\ & \textbf{return } \alpha_{1,T}^\top \textbf{1} \end{aligned}$$

Low-Rank Factorization

▶ Factor matrices $\Psi \in \mathbb{R}^{L \times L}$ into product of $U, V \in \mathbb{R}^{L \times R}$

- ▶ Two matrix-vector products of cost O(LR) each
- Also holds for rectangular Ψ

Hypergraph Marginalization

- Hypergraph represents dynamic program for exact inference
- Hyperedge consists of head node u and tail nodes $v = (v_1, v_2,...)$
- ► PICTURE

Hypergraph Marginalization Algorithm

Algorithm Hypergraph marginalization	
for $u \leftarrow v$ hyperedge e topologically do	
$\alpha_{\it u} \stackrel{+}{\leftarrow} \Psi_{\it e} \beta_{\it v}$	$\triangleright O(L^{ e +1})$
return $lpha_{\mathcal{S}}^{ op}1$	

Algorithm Low-rank marginalization	
for $u \leftarrow v_1, v_2$ hyperedge e topologically do $\gamma \leftarrow V_e^\top \beta_v$ $\alpha_u \stackrel{+}{\leftarrow} U_e \gamma$ return $\alpha_S^\top 1$	$ > O(L^{ e }) $ $ > O(LR) $

Experiments

Experiments

TODO

► Language modeling on PTB

▶ Feature map $\phi(U) = \exp(UW)$, with learned $W \in \mathbb{R}^{R \times R}$

▶ Baseline: Softmax HMM
